Local Discontinuous Galerkin Method for the Thin Film Diffusion Equation

We would like to solve the 1D thin film diffusion equation with a Discontinuous Galerkin Method. The 1D diffusion equation is given as

 $q_t = -\left(q^3 q_{xxx}\right)_x.$

If we consider a single cell I_j , do a linear transformation from $x \in \left[x_{j-1/2}, x_{j+1/2}\right]$ to $\xi \in [-1, 1]$, and consider specifically the Legendre polynomial basis $\left\{\phi^k(\xi)\right\}$ with the following orthogonality property

$$\frac{1}{2} \int_{-1}^{1} \phi^{j}(\xi) \phi^{k}(\xi) \,\mathrm{d}\xi = \delta_{jk}$$

we can form a more concrete LDG method for implementing. The linear transformation can be expressed as

$$x = \frac{\Delta x}{2}\xi + \frac{x_{j-1/2} + x_{j+1/2}}{2}$$

or

$$\xi = \frac{2}{\Delta x} \left(x - \frac{x_{j-1/2} + x_{j+1/2}}{2} \right)$$

After this tranformation the diffusion equation become

$$q_t = -\frac{16}{\Delta x^4} \left(q^3 q_{\xi\xi\xi} \right)_{\xi}$$

on the cell I_i .

We can then write this as the following system of first order equations.

$$r = \frac{2}{\Delta x} q_{\xi}$$

$$s = \frac{2}{\Delta x} r_{\xi}$$

$$u = \frac{2}{\Delta x} q^{3} s_{\xi}$$

$$q_{t} = -\frac{2}{\Delta x} u_{xi}$$

Now approximate r, s, u, and q on I_j as

$$r \approx r_h = \sum_{k=1}^{M} \left(R_k \phi^k(\xi) \right)$$
$$s \approx s_h = \sum_{k=1}^{M} \left(S_k \phi^k(\xi) \right)$$
$$u \approx u_h = \sum_{k=1}^{M} \left(U_k \phi^k(\xi) \right)$$
$$q \approx q_h = \sum_{k=1}^{M} \left(Q_k \phi^k(\xi) \right)$$

Plug into the equations and multiply by Legendre polynomials and integrate.
